ş

Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard, it will be indicated in the annotation.

Adrian The repeat regions shown were identified using RepeatMasker by

Sequence similarities were identified using Powerblast by Jinghui

were canonical splice junctions that across the splice junctions. Exon/Intron boundaries of identified genes were chosen if there maintained sequence continuity

On Apr 8, 1998 this sequence version replaced gi:2578104.

IMPORTANT: This sequence is the entire insert of clone 415C1.

true left end of clone 415C1 is at 1 in this sequence. The true right end of clone C333B10 is at 8634.

The true left end of clone C367G8 is at 23683.

415C1 is from a 400kb clone contig on 16p.

415C1 is from a 400kb clone contig on 16p.

                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                      CDS

                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel human conductin protein which has anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Mingless signalling pathway in vertebrates. Conductin also binds to adenomatous Polyposis Coli (APC)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tumor-suppressing protein conductin diagnosis of tumors

Nucleic acids encoding mutant and wild type Axin and oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a sullikely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The type Axin and homologues of Axin are useful for treating sul

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.

The products of the invention have cytostatic, anti-allergic, immunosuppressive and antimicrobial activity. The antibodies are useful as therapeutic agents for regulating cellular proliferation and differentiation and for treating all kinds of cancers, immune diseases such as allergic, autoimmune, and rheumatologic diseases, transplant rejection, and as anti-infectives for fighting viral, bacterial, parasitic and fungal infections. The encoded protein participates in the regulation, control and/or modulation of G-protein mediated signal transduction, involved in T cell activation, including T-helper (TH) cell and TH cell subpopulation activation. The protein can be used to develop products for treating autoimmune disorders, arthritis, graft rejection, asthma, allergy, infections or neoplasms.

                                                                                                                                                                                                                          8 Clones (T43376-83) contg. interleukin-2 (IL-2)-induced genes were isolated from a human IL2 receptor-positive T blast cell cDNA library following IL-2 stimulation. 6 Of these ligand-induced genes (CRI, 2, 3, 5, 6, 8) are novel. CRI expression is rapidly and transiently induced by IL-2, and mRNA expression is suppressed by elevated intracellular cAMP. It encodes an intracellular protein (W08133) that shows homology to GOS8 and BL-34. CR genes and polypeptides (W08133-40) can be used as diagnostic or therapeutic agents; CR gene sequences can be used to detect and treat allelic

The products of the invention have cytostatic, anti-allergic, immunosuppressive and antimicrobial activity. The antibodies are useful as therapeutic agents for regulating cellular proliferation and differentiation and for treating all kinds of cancers, immune diseases such as allergic, autoimmune, and rheumatologic diseases, transplant rejection, and as anti-infectives for fighting viral, bacterial, parasitic and fungal infections. This sequence encodes the human CR1 protein described in the invention.
                                                                                                                                                                                         regulation; activation; modulation; signal transduction; T Cell; T helper cell; treatment; autoimmune disorders; arthritis; infection; graft rejection; asthma; allergy; neoplasm; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence encodes human regulator of G-protein signalling (HRGS). The HRGS regulates G-protein signalling in cancer cells and may be useful in the treatment of any cancer, especially cancers of the brain and thyroid. Products of the present invention can also be used for treating other conditions associated with uncontrolled cell signalling such as inflammation. The products can also be used to modulate HRGS activity in response to disorders involving the sympathetic nervous system including hypertension, cardiovascular shock, arrhythmias and asthma. The products can also be used for detection,

Both proteins have unique N- and C-terminal sequences. The C-terminal location of the RGS domain is consistent with RGSs known to act as GTPase activating proteins (GAPs) for G-alpha proteins. G-alpha-1 linked receptors support rapid adhesion and directed migration of leukocytes and other cell types. The novel RGS proteins may be used to modulate cell adhesion and chemotaxis, e.g. for aiding wound repair. The RGS proteins, related cDNAs and anti-RGS antibodies are useful for modulation, diagnosis and treatment of immune and respiratory disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5
protein, RGS5. The specification also describes an activator of G protein signalling (ARS) protein. The AGS cDNA sequence was isolated from a human liver cDNA library. The AGS protein exhibits homology to ras-related G proteins, and contains alterations in conserved amino acids consistent with a deficiency in GTP hydrolysis activity. AGS stimulates G protein activity, G protein-coupled signal transduction and the pheromone response pathway in a receptor-independent manner. The AGS protein also shows G-gamma selectivity, as measured by growth asseays in yeast expressing various mammalian G-gamma constructs, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Activator of G protein signalling; AGS; ras-related G protein; GTP hydrolysis; G protein activity; pheromone response pathway G protein coupled signal transduction; G-gamma selectivity; cellular signal transduction; regulator of G protein signalling.
                                                                                                                                                             Claim
                                                                                                                                                                                    A new activator of G protein signalling used to treat disorders characterized by an aberrant {\sf AGS} protein activity -

The AGS protein can be used to screen for compounds that modulate cellular signal transduction. The protein is used to treat disorders characterized by an aberrant AGS protein activity or AGS nucleic activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 their corresponding secreted proteins. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each polynucleotide, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer; immune disorders, infection, inflammatory disorders, skin disorders, tunours, atherosclerosis, restenosis, autoimmune disorders, they are disorders, seeletal disorders, highlers, hematopoietic disorders, seeletal disorders, neuropathies, trauma, spinal cord injuries, allergy, hematopoietic disorders, asthma, immunodeficiency diseases, AIDS and transplant rejection. The polypeptides are also useful for identifying their
